ABSTRACT: When longitudinal data contains outliers, the classical least-squares approach is known to be not robust. To solve this issue, the exponential squared loss (ESL) function with a tuning parameter has been investigated for longitudinal data.

Diggle and Kenward (1994) discussed a parametric approach to the problem of analysing longitudinal data with drop-outs, based on a selection factorization. In the special case of model (2), the Diggle and Kenward model reduces to $(Z_1, Z_2)' \sim N(0, \sigma^2 V)$ with V as in equation (5), and.

A model is proposed for continuous longitudinal data with non-ignorable or informative drop-out (ID). The model combines a multivariate linear model for the underlying response with a logistic regression model for the drop-out process.
