step process resulting in the net movement of cholesterol from peripheral tissues back to the liver first via entering the lymphatic system, then the bloodstream.

Cholesterol from non-hepatic peripheral tissues is transferred to HDL by the ABCA1 (ATP-binding cassette transporter).

Apolipoprotein A1 (ApoA-1), the major protein component of

## Read Online Cholesterol

HDL, acts as an acceptor, and the phospholipid component of HDL acts as a sink for the mobilised cholesterol.

### **Reverse cholesterol transport - Wikipedia**

Cholesterol Transport, Uptake, Control. Cholesterol is exported to the peripheral tissues in LDL and VLDL. About 70 percent of the

# Read Online Cholesterol

cholesterol molecules in LDL are esterified with a fatty acid (for example, palmitate) on the OH group (at Carbon 3; see Figure 1 ). Cells take up cholesterol from the LDL by means of LDL receptors in the outer cell membrane.

## **Cholesterol Transport, Uptake, Control**

Reverse cholesterol transport (RCT) is the

pathway for removal of peripheral tissue cholesterol and involves transport of cholesterol back to liver for excretion, starting from cellular cholesterol efflux facilitated by lipid-free apolipoprotein A1 (ApoA1) or other lipidated high-density lipoprotein (HDL) particles within the interstitial space.

cholesterol your body needs. Cholesterol and other fats are carried in your bloodstream as spherical particles called lipoproteins.

### **Cholesterol in the Blood | Johns Hopkins Medicine**

To get around this problem, the body packages cholesterol and other lipids into minuscule protein-covered particles that mix easily with blood.

## Read Online Cholesterol

These tiny particles, called lipoproteins (lipid plus protein), move cholesterol and other fats throughout the body. Cholesterol and other lipids circulate in the bloodstream in several different forms.
