Goal programming is a branch of multiobjective optimization, which in turn is a branch of multi-criteria decision analysis (MCDA). It can be thought of as an extension or generalisation of linear programming to handle multiple, normally conflicting objective measures. Each of these measures is given a goal or target value to be achieved. Deviations are measured from these goals both above and below the target. Unwanted deviations from this set of target values are then minimised in an achievement

Goal programming is one approach to dealing with problems of this kind. Goal programming formulation To deal with these two objectives in our example problem via GP we need to introduce extra variables - these variables deal with the deviation from the goal for each objective. To proceed we need to decide a numeric goal for each objective.
