Overview. The propagation of waves along and across the boundary between two media with different characteristic velocities is much more complicated when the source is on or near the boundary than when it is far away and the incident waves are plane. Examples of waves generated by localized sources near a boundary are the electromagnetic waves from the currents in a dipole on the surface of the earth and the seismic waves from a slip event in a fault in the earth's crust like the San Andreas ...

Lateral electromagnetic waves : theory and applications to communications, geophysical exploration, and remote sensing. [Ronold W P King; Margaret Owens; Tai Tsun Wu] -- This work, starting from a coverage of electromagnetic surface waves, goes on to introduce the unusual properties and useful applications of lateral waves, particularly the case of dipoles on the ...

Abstract: Lateral electromagnetic waves along a plane boundary between homogeneous half-spaces are reviewed. The electromagnetic fields generated by vertical and horizontal electric dipoles near the boundary between air and the earth (salt or fresh water, soil, ice, etc.) are summarized in terms of a new unified theory of lateral-wave propagation.

Abstract: The propagation of lateral electromagnetic waves and pulses on microstrip is investigated. Interference patterns generated by the superposition of the lateral and direct waves along the air-substrate surface are shown. The field generated by the pulse excitation of a horizontal dipole on the air-substrate boundary is shown to consist of a lateral-wave pulse and a slower direct-wave ...

Later on, the simultaneous, but separate discoveries made by Michael Faraday and Joseph Henry concerning electromagnetic induction in the 1830's led to the theory of James Clerk Maxwell, which united electricity, magnetism, and optics into one grand theory of light: the explanation of electromagnetic waves.

Electromagnetic Waves: Origin and Theory - Science Struck

Electromagnetic waves are shown by a sinusoidal graph. It consists of time-varying electric and magnetic fields which are perpendicular to each other and are also perpendicular to the direction of propagation of waves. Electromagnetic waves are transverse in nature.

It alternates in direction (red for up, blue for down) making a wave, and carries with it a magnetic field and electromagnetic energy. The electromagnetic wave disturbs the electric field at any point through which it passes. It therefore moves the charges in the metal loop, causing a current.

Lateral waves are the electromagnetic waves which are generated by vertical or horizontal dipoles on/or near the plane boundary between two electrically different media like air and earth or air and sea or ocean water. However, the lateral wave propagates from the antenna to the

The surface plasmon polariton (SPP) is an electromagnetic surface wave that can travel along an interface between two media with different dielectric constants. It exists under the condition that the permittivity of one of the materials forming the interface is negative, while the other one is positive, as is the case for the interface between air and a lossy conducting medium below the plasma ...

Surface wave - Wikipedia

Electromagnetic Wave Theory is a theory in chemistry that was developed by James Clark Maxwell in 1864. According to this theory, there are several points about radiation emitted from a substance. These points are as follows: Energy emits from any source continuously in the form of radiant energy.

A linearly polarized sinusoidal electromagnetic wave, propagating in the direction + z through a homogeneous, isotropic, dissipationless medium, such as vacuum. The electric field (blue arrows) oscillates in the $\pm x$ -direction, and the orthogonal magnetic field (red arrows) oscillates in phase with the electric field, but in the $\pm y$ -direction. In physics, electromagnetic radiation (EM radiation or EMR) refers to the waves (or their quanta, photons) of the electromagnetic field ...
