Econometrics in Practice: A Guide to GeoDa ...

In practice, the construction of the spatial weights from the geometry of the data cannot be done by visual inspection or manual calculation, except in the most trivial of situations. To assess whether two polygons are contiguous requires the use of explicit spatial data structures to deal

Modern Spatial

Econometrics...

In practice, the parameters are seldom estimated, but typically set to a fixed value, such as $\alpha = 1$ for inverse distance weights ($1 / d_{ij}$), and $\alpha = 2$ for gravity weights ($1 / d_{ij}^2$). By convention, the diagonal elements of the spatial weights are set to zero and not computed.

Geospatial
Analysis

The core input into the determination of a neighbor relation for distance-based spatial weights is a formal measure of distance, or a distance metric. The most familiar case is the Euclidean or straight line distance, d
