Transformer Winding Formula **Formula | Refrigerator Stabilizer**

You need to use a simple formula to determine the number of turns for the primary winding multiply the coefficient "40" by the voltage (in the primary circuit it is 220 V), after which this amount is divided by the cross-sectional area of the magnetic circuit.

assumed primary
number of turns as
100. If this can be
reduced to 50 then
that is also fine. 110V
to 290V $V_{pri}/V_{sec} = N_{pri}/N_{sec}$
 $N_{pri}/N_{sec} = N_{sec} =$
 N_{pri}/N $290V/230V =$
 1.26 , $N_{sec} = 100 / 1.26$
 $= \sim 79$

Size of Secondary Wire
for Transformer Design
Calculation. $a^2 = (4.2$
 $A / 2.3) = 1.83 \text{ mm}^2$.

From the standard
copper wire, table it
can be seen that wire
of this thickness is of
15 gauge. So,

Transformer Design
Calculation for
secondary winding we
need 15 gauge wire.
Hence , Secondary
Wire = 15 AWG.

Transformer Winding Formula **Calculations for Design Parameters of Transformer ...**

What will be the turns ratio (TR) of the transformer. This ratio of 3:1 (3-to-1) simply means that there are three primary windings for every one secondary winding. As the ratio moves from a larger number on the left to a smaller number on the right, the primary voltage is therefore stepped
